

HireIQ

Candidate Report — Ahmad_Islam

SCORE SUMMARY

Metric	Score
Final Score	35.76 / 100
Grade	■ Poor
Skill Score	50.0 / 100
Keyword Score	23.02 / 100
Experience Score	0.0 / 100

SKILL GAP ANALYSIS

Match Score: 50.0%

Matched Skills: flask, git, langchain, machine learning, numpy, pandas, python, rag

Missing Skills: deep learning, go, keras, llm, pytorch, r, scala, tensorflow

INTERVIEW QUESTIONS

Strength Based:

1. Explain the core components of a Retrieval-Augmented Generation (RAG) system. In your Medical RAG Chatbot project, how did you select and prepare the medical documents for the vector database, and what strategies did you employ to ensure the retrieved context was relevant and reduced hallucinations?
2. You developed a BMI Calculator using Logistic Regression. Can you walk me through the data preprocessing steps you undertook for the height and weight data? Specifically, how did you handle potential outliers or non-normal distributions, and what impact did these steps have on your model's 85-90% accuracy?
3. You've used both Flask and Streamlit for model deployment, and also listed FastAPI. Describe a scenario where you would choose Flask over Streamlit or FastAPI for deploying a machine learning model, detailing the considerations you'd have regarding API design, scalability, and user interaction.
4. In your RAG projects, how did you utilize LangChain to orchestrate the different components, such as document loading, text splitting, embedding, vector store interaction, and LLM invocation? Can you outline a specific chain you might have built and explain its flow?
5. Describe a challenging situation you encountered while using Git for version control, either in a team project or a personal project with multiple branches. How did you diagnose and resolve the issue, and what specific Git commands or strategies did you use?
6. Imagine you need to develop a custom neural network architecture for a novel research task that requires significant flexibility in defining layers, custom loss functions, and experimental model training. Based on your theoretical understanding, which deep learning framework, TensorFlow or PyTorch, might be more suitable for this kind of research-oriented development, and why?
7. Beyond the structured data and classification tasks you've worked on, where do you see the most impactful applications of deep learning that are difficult to achieve with traditional machine learning

methods? Can you provide an example from a domain you find particularly interesting?

Weakness Based:

1. While you haven't explicitly listed deep learning frameworks like TensorFlow or PyTorch, can you explain the fundamental architectural differences between traditional machine learning algorithms (like the Logistic Regression you used) and deep learning models, particularly concerning feature extraction and handling complex, unstructured data?
2. You've integrated LLMs (Large Language Models) like Gemini into your RAG projects. Beyond just using their APIs, what are some of the key architectural innovations or training paradigms that differentiate large language models from simpler neural network architectures, and how do these contribute to their emergent capabilities?
